

Sharebot profiles using annotation

Nibionno (Lecco), 31.05.16

Sharebot profiles allow you to use properly the Sharebot 3D printers: the settings are prepared to give you the possibility to print the large part of the possible shapes with good quality and results. The profiles have different setting and instruction: without them it's not possible to use your 3D printer correctly.

In case you need to print with PLA-S, the most common 3D printing material, you have two different kind of profiles: standard and high speed. Both of them will give you a good printing speed, but the standard one has few more conservative settings.

To print with PLA-S and Nylon-Carbon you need to spray the printing plate (outside the printer) with the provided fixture. To print correctly the TPU, we suggest to use a lot of fixture on the printing plate.

To print with ABS-HF you'll have to use the dedicated KIT (upper enclosure, specific magnetic printing bed, etc.). Fill the support form on website support pages to know more.

Detector

Using PLA-S, ABS-HF and Nylon-Carbon profiles, the filament detect is active by default. You can switch off it through the touch screen display during the printing process.

Using the TPU filament, the detector is deactivate to give to the user the possibility to select the best location for the spool: inside its provided placement or outside it (as it's possible to place it to ease the usability).

Using table

	PLA-S	ABS-HF	NYLON-CARBON	TPU
Printing bed	Spray	Dedicated plate	Spray	Much spray
Filament detector	Attivo	Active	Active	Deactivate
Chamber	/	Closed	/	/
Layer height	0.1 - 0.2 - 0.3	0.1 - 0.2	0.15 - 0.2	0,3

Enjoy your prints!
